Supraventricular tachycardia

Cardiac Arrhythmias: Practical Notes on Interpretation and Treatment. John Wiley & Sons. p. 49. ISBN 9781118432402. Archived from the original on 2016-10-02

Supraventricular tachycardia (SVT) is an umbrella term for fast heart rhythms arising from the upper part of the heart. This is in contrast to the other group of fast heart rhythms – ventricular tachycardia, which starts within the lower chambers of the heart. There are four main types of SVT: atrial fibrillation, atrial flutter, paroxysmal supraventricular tachycardia (PSVT), and Wolff-Parkinson-White syndrome. The symptoms of SVT include palpitations, feeling of faintness, sweating, shortness of breath, and/or chest pain.

These abnormal rhythms start from either the atria or atrioventricular node. They are generally due to one of two mechanisms: re-entry or increased automaticity. Diagnosis is typically by electrocardiogram (ECG), Holter monitor, or event monitor. Blood tests may be done...

Right axis deviation

Review and Assessment. Elsevier Health Sciences. ISBN 9780323375405. Bennett, David H. (2006-09-29). Cardiac Arrhythmias 7th Edition: Practical Notes on Interpretation

The electrical axis of the heart is the net direction in which the wave of depolarization travels. It is measured using an electrocardiogram (ECG). Normally, this begins at the sinoatrial node (SA node); from here the wave of depolarisation travels down to the apex of the heart. The hexaxial reference system can be used to visualise the directions in which the depolarisation wave may travel.

On a hexaxial diagram (see figure 1):

If the electrical axis falls between the values of -30° and $+90^{\circ}$ this is considered normal.

If the electrical axis is between -30° and -90° this is considered left axis deviation.

If the electrical axis is between $+90^{\circ}$ and $+180^{\circ}$ this is considered right axis deviation (RAD).

RAD is an ECG finding that arises either as an anatomically normal variant or an indicator...

Goulstonian Lecture

Amyloidosis and the Acute Phase Response 1983 Paul V L Curry, "Clinical cardiac arrhythmias

the way ahead" 1984 Andrew Jackson Rees, Influences on the severity - The Goulstonian Lectures are an annual lecture series given on behalf of the Royal College of Physicians in London. They began in 1639. The lectures are named for Theodore Goulston (or Gulston, died 1632), who founded them with a bequest. By his will, dated 26 April 1632, he left £200 to the College of Physicians of London to found a lectureship, to be held in each year by one of the four youngest doctors of the college. These lectures were annually delivered from 1639, and have continued for more than three centuries. Up to the end of the 19th century, the spelling Gulstonian was often used. In many cases the lectures have been published.

Gulston's widow bequeathed the annual donation to the College of Physicians for them to arrange for one of the four youngest doctors to "read the lecture...

Traumatic brain injury

complications that include cardiac arrhythmias and neurogenic pulmonary edema. These conditions must be adequately treated and stabilised as part of the

A traumatic brain injury (TBI), also known as an intracranial injury, is an injury to the brain caused by an external force. TBI can be classified based on severity ranging from mild traumatic brain injury (mTBI/concussion) to severe traumatic brain injury. TBI can also be characterized based on mechanism (closed or penetrating head injury) or other features (e.g., occurring in a specific location or over a widespread area). Head injury is a broader category that may involve damage to other structures such as the scalp and skull. TBI can result in physical, cognitive, social, emotional and behavioral symptoms, and outcomes can range

from complete recovery to permanent disability or death.

Causes include falls, vehicle collisions, and violence. Brain trauma occurs as a consequence of a sudden...
