health directly. For example, chronically occurring environmental stressors affecting the hypothalamic-pituitary-adrenal axis, cumulatively, can harm health. Behavioral factors can also affect a person's health. For example, certain behaviors can, over time, harm (smoking or consuming excessive amounts of alcohol) or enhance (engaging in exercise) health. Health psychologists take a biopsychosocial approach. In other words, health psychologists understand health to be the product not only of biological processes...

Occupational health psychology (OHP) is an interdisciplinary area of psychology that is concerned with the health and safety of workers. OHP addresses a number of major topic areas including the impact of occupational stressors on physical and mental health, the impact of involuntary unemployment on physical and mental health, work-family balance, workplace violence and other forms of mistreatment, psychosocial workplace factors that affect accident risk and safety, and interventions designed to improve and/or protect worker health. Although OHP emerged from two distinct disciplines within applied psychology, namely, health psychology and industrial and organizational (I-O) psychology, historical evidence suggests that the origins of OHP lie in occupational health/occupational medicine.

A professional practitioner or researcher involved in the discipline is called a psychologist. Some psychologists can also be classified as behavioral or cognitive scientists. Some psychologists attempt to understand the role of mental...

Cross-cultural psychology is the scientific study of human behavior and mental processes, including both their variability and invariance, under diverse cultural conditions. Through expanding research methodologies to recognize cultural variance in behavior, language, and meaning it seeks to extend and develop psychology. Since psychology as an academic discipline was developed largely in North America and Europe, some psychologists became concerned that constructs and phenomena accepted as universal were not as invariant as previously assumed, especially since many attempts to replicate notable experiments in other cultures had varying success. Since there are questions as to whether theories dealing with

International or global psychology is an emerging branch of psychology that focuses on the worldwide enterprise of psychology in terms of communication and networking, cross-cultural comparison, scholarship, practice, and pedagogy. Often, the terms international psychology, global psychology, transnational psychology, and cross-cultural psychology are used interchangeably, but their purposes are subtly and importantly different: Global

means worldwide, international means across and between nations, transnational means to transcend the nation-state, cross-cultural means across cultures. In contrast, the term "multicultural" is more often used to refer to ethnic and other cultural differences existing within a given nation rather than to global or international comparisons.
